TOPIC TAGS: automation equipment, industrial instrument

ABSTRACT: The organizational chart for the Department for Instruments and Automation at Danube Iron Works (Dunai Vasmu Meszer es Automatikai Osztalya) was presented and discussed. The Department comprises the operational section, the central instrument repair section, the development section, and the measurement section. The operations and organization of the individual sections was described in some detail. The Department employs 295 persons, of whom only four are administrative. The area occupied by the Department is 2393 sq. m.; an amount of approximately Ft. 170 million is invested in the Department's capital facilities, including over 16,200 pieces of instruments or communications equipment. Financial data for the first half of the year 1964 were presented. Orig. art. has: 2 tables. [JPRS: 34,166]

- Abstract : On a filter paper are placed 0.01 ml of the solution being analyzed (diameter of the spot about 5 mm), the paper is placed in a special chamber containing an atmosphere of CO₂, and chromatography is performed with the use of a suitable solvent. About ten different solvent mixtures were studied. The best was found to be a mixture (1:1) of n-butyl alcohol and 2 N HNO₃, containing 1% acetylacetone (I). On use of this solvent, due to the formation

of a chelate compound of Fe^{3+} with I, a good separation of Fe^{2+} and Fe^{3+} is effected. The complex of Fe^{3+} with I is colored red and therefore no spraying of the chromatogram is needed to reveal the Fe^{2+} . On drying of the chromatogram the Fe^{2+} is oxidized to Fe^{3+} and forms a complex with I, so that the spot which corresponds to Fe^{2+} also becomes visible. On using standard chromatograms Fe^{2+} and Fe^{3+} can be determined quantitatively with an error of $\pm 20\%$. The principle of the described method can be applied also to other elements of varying valency.

Periodical:

Nikotin alkalmazása egyes nehezfém-ionok papirkromatografias elvalasztásában, Magyar kem. folyoirat, 1956, 62, No 2, 68-71;
Hungarian; German resume

Abstract:

In separation of Fe^{3+} , Cu^{2+} , Co^{2+} , Ni^{2+} and Ti^{4+} use is made, as the spraying agent, of nicotine in the presence of NH_4SCN or $\text{K}_4[\text{Fe}(\text{CN})_6]$. As developing agent served a mixture acetone-HCl-H₂O (85:10:5). The method is suitable for semi-quantitative determination of Cu^{2+} , Co^{2+} and Ni^{2+} on the chromatogram.

Title : The Eoetvoes Equation (on the Measurement of the Free Energy of Liquid Surfaces)

Orig Pub: Zap. Leningr. Gorn. In-ta, 1956, Vol 32, No 3, 97-119

Abstract: On the basis of a thorough study of the Eoetvoes equation $\sigma' = K(T_c - T) \Delta T$ (1) and similar equations proposed by other investigators as well as on the basis of the concept that molecules in the surface film are restricted in their freedom of movement, i.e. lose a given number of degrees of freedom, the author proposes to write equation (1) in the form: $\sigma' S_m = z(z-i)R \Delta T$ (2), where S_m is the area per mole of substance in the film and z and i are the degrees of freedom of the molecules in the vapor and in the film, respectively; R is the gas constant. The author concludes that the

Card : 1/2

Abs Jour: RZh--Kh, No 3, 1957, 7700

magnitude of $\Delta T/\sigma'$, which is proportional to S_m , better expresses the structure of the oriented molecules in the film than does the deviation of the constant K in equation (1) from its normal value. On the basis of the above presented considerations, curves of the type $\Delta T/\sigma' = f(\theta)$ ($\theta = T/T_c$) have been plotted, and the values of S_m for members of homologous series of ethers, alcohols, acids, amines, and hydrocarbons as well as for simple inorganic molecules have been calculated. It is shown that in all the series S_m increases with the chain length, thus pointing to a plane orientation of the chains in pure liquid films (with a few exceptions), notwithstanding the Langmuir hypothesis. The magnitude of K in equation (1) is constant within each series and differs for mono-, di-, and polyatomic molecules. It is shown that equation (2) leads to values for S_m which are in good agreement with data published in the literature. The shape of the curves $\Delta T/\sigma'$ vs. θ makes it possible to estimate the degree of association between the molecules of the liquid and its change with T.

"Poultry Breeding in State Agricultural Farms."

Bucharest, Revista de Zootehnie si Medicina Veterinara, Vol 13, No 4, Apr 63; pp 14-18.

Abstract: A historical review of the development of poultry breeding in various state farms in different regions of Rumania after World War II: there was a very rapid increase after 1958 and a further intensive increase is planned. Details regarding objectives and necessary steps to be taken so as to achieve the former are discussed.

"Problems Concerning the Intensive Development of Animal Breeding."

Bucharest, Revista de Zootehnie si Medicina Veterinara, Vol 13, No 11, Nov 63, pp 5-15.

Abstract: Reviews the importance of animal breeding for the national economy and the importance of the state farms that specialize in animal production. Proposes for adoption such measures as the improvement of animal strains, the introduction of new strains, the extension of artificial insemination, the reduction of losses caused by epizooties, mechanization, and the application of scientific feeding and care methods. Traces the evolution of animal husbandry in the state farms and cites some results, pointing out that from 1956 to 1962 the stock of large cattle increased by 2.9 times and the value of total production by over 3.8 times.

TITLE: Low-Oil Content ChKD 380-kv Circuit Breakers

PERIODICAL: Chekhosl. tyazh. prom-st', 1958 (Spets. Nr. "Vsemirn. vyst. v
Bryussele"), pp 20-21

ABSTRACT: Type VMR 380, 380-kv, 1,200-amp, 12,000-Mva low-oil-content
circuit breakers developed by ChKD plants (Czechoslovakia) are described.
These circuit breakers are final in the series of breakers manufactured for
voltages from 3-kv. The circuit breaker consists of three identical poles
connected only electrically. Each pole is mounted on a welded support frame
on which two support tripods of pin-type insulators are arranged. Each tripod
carries on its top two V-shaped arc-rupturing devices. Uniform voltage
distribution is assured by a capacitive divider whose current as high as a few

Card 1/2

SOV/112-59-1-767

Low-Oil Content ChKD 380-kv Circuit Breakers

Current can be cut off by a conventional disconnecting switch. The circuit breaker is closed by a pneumatic actuator, and is opened by springs. One of the insulator stacks of each tripod can rotate about its axis. It is connected on the bottom with the pneumatic actuator and on the top with an arc-rupturing contact mechanism and transmits the motion from the former to the latter. Each of the two arc-rupturing devices carries a common oil gauge. The insulator stacks are equipped with guard rings. Each pole is 7,700-mm long, 7,250-mm high; the circuit breaker weighs about 19,000 kg. Its wet test 50-cps voltage is 30 kv (?), its impulse test voltage is 1,450 kv with 1/50 microsec wave.

(*Rutilus rutilus*, esp.)

Orig Pub : Biol., prace, 1956, 2, No 13, 7-60

Abstract : Spawning season of the roach is determined by a temperature factor, in the south it spawns in May, in the North - down to the middle of June. Eggs are accumulated on plants to a depth of 5 cm. In the postembryonic development there are 7 distinct stages: A. 1 day; larvae hang with the head down or lie immobile on the bottom; feeding is endogenous, B. 2-3 days; larvae swim horizontally with jerks; mixed feeding; beginning of gill respiration. C₁. 4-9 days; they swim in all directions with jerks; feeding is exogenous. C₂. 10-17 days; dimensions up to 10.5 mm;

they swim in groups; beginning development of the tail fin. D. 18-26 days; length up to 13.8 mm; they swim in groups rapidly and regularly, without jerks; forward cavity of the air bladder is filled with air; rudiments of the lepidotrdchde ossification of rays of the spine and anal fin. E. 27-35 days; length up to 16 mm; ossification of the lipidotrdchde and their dissection. F. 36-49 days; length up to 24.2 mm; scale formation begins. G. up to 50 days; length up to 28.1 mm; scales cover the whole body. Ossification of the skeleton begins at stage B, is completed at stage F. -- A.G. Andres

Downstream of Bratislava, and a Description of Fish Poisoning with
Toxaphene."

Bratislava, Biologia, Vol 21, No 4, 1966, pp 295 - 307

Abstract: The author describes the results of spraying the water in an arm of the Danube river with the insecticide Toxaphene. The process of poisoning the fishes is described; the young fish die before the older ones. During summer a concentration of 0.2 ppm kills all the fish, in winter 0.3 ppm are required. The author used poisoning to count the dead fish and determine the species, their weights and other characteristics. 3 Figures, 4 Tables, 12 Western, 10 Czech, 4 Russian references.

PROCESSES AND PROPERTIES INDEX

Viscosity of blast-furnace slags. I. D. Balon. *Stal* 6, 344-53(1940).—The slags studied were divided into 2 main groups: slags contg. FeO 10-20% and those contg. more than 20%. Within these main groups various slag compns. were studied. The various compns. were obtained by adding one or another component to a natural slag. The viscosity of slags contg. less than 42% of SiO₂ increases sharply in a narrow range of temp. The viscosity of more acid slags rises slower with temp. drop. This is explained by the relative quantity of SiO₂ and FeO present, since it determines whether the eutectic fayalite-SiO₂ or fayalite-FeO is formed. The m.p. of the latter is higher. For slags of both main groups there are SiO₂ contents at which the viscosity is at a min. For group I (10-20% FeO) this occurs at around 40% of SiO₂, and for group II (more than 20% FeO) at 27.8% of SiO₂. An increase in the CaO content raises the solidification point of slag. The rise in the solidification temp. with an increase of CaO is sharper for slags of group II. The min. isothermal viscosity is at a CaO content of 20-30%. The effect of MgO was to raise the solidification temp. and the viscosity. This is contrary to the results of other investigators. This discrepancy in the results is caused by the difference in the compn. of first and final slags. (In this investigation first slags were studied.) MnO raises the solidification temp. but somewhat lowers the viscosity. FeO lowers the solidification temp. The min. isothermal viscosity of group-I slags is at an FeO content of 15%, and of group-II slags at 27%. Based on these results, conclusions are drawn on operating a blast furnace in a manner to prevent undesirable slag. — M. Husek

TITLE: Operation of Blast Furnaces Under Increased Gas Pressures
(Opyt raboty domennikh pechey na povyshennom davlenii gazov)

PERIODICAL: Byul. nauchno-tekhn. inform. Ukr. n.-i. in-t metallov,
1957, Nr 2, pp 13-24

ABSTRACT: Operation of blast furnaces located in southern USSR that operate with increased gas pressures (IGP) is described, also procedures for the maintenance of equipment and auxiliary devices and certain peculiarities of the smelting process. Investigations have shown that the depth of the oxidizing zone diminishes when IGP are employed; the temperature of the shaft lining at the upper and lower levels is reduced; the pressure drop between the tuyeres and the charging hopper is also reduced, the greatest pressure losses occurring in the lower and upper sections of the furnace; smooth operation of the furnace is achieved; this makes it possible to conduct smelting operations with smaller heat reserves and the resulting pig iron contains smaller amounts of Si and Mn and increased amounts of C.

Card 1/2

137-58-5-9000

Operation of Blast Furnaces Under Increased Gas Pressures

Variations in the distribution of the materials at the hopper affect the pressure losses which occur between the hopper and the second level, whereas variations in the temperature and volume of the blast influence the magnitude of losses between the second level and the tuyeres. This fact makes it possible to control the pressure drop between the tuyeres and the second level by regulating the temperature and the volume of the blast, while the pressure drop between the second level and the hopper is controlled by varying the pressure at the hopper. The establishment of this relationship permits the utilization of the static pressure for the automatic regulation of the operation of the furnace. The employment of IGP (up to 0.5-0.6 at gas pressure) increased the output by 6-8%, the efficiency of the smelting process by 5.5-6.0%, and reduced the consumption of coke by 1.2-2.5%; the amount of dust carried off was reduced by 20-40%.

EXCERPTA MEDICA Soc.9 Vol.12/4 SURGERY April 1958

2085. THE USE OF LOCAL COOLING IN RECONSTRUCTIVE SURGERY

(Russian text) - Balon L.R. - VESTN. KHIR. 1957, 78/6 (95-100) Illus. 8
In the first postoperative days owing to impairment of circulation the local tissue metabolism has to depend on the nutrient components stored in cells and interstitial spaces. Every local rise of temperature leads to acceleration of the combustion of these rests before the development of the vascular bed has taken place. Local cooling reduces the metabolism rate and the nutrients in store last a longer time thus helping the tissues to restore their blood supply. The circulatory disturbance in so-called 'blue flaps' is found to promptly subside when treated by cooling. A great number of observations suggest the inadvisability of the application of heat in the first postoperative days; it should not be used before the 10th, 12th, 14th day by which time the vascular bed will have formed. The method of cooling is described and the outcomes are presented.
